1 **I. INTRODUCTION**

2 As the Satellite Defendants' motion detailed, the Yurt patents are nothing more than a
3 starting point for future research and development. Rather than describing the invention so that a
4 skilled artisan could recognize or use what was claimed, the specification and claims often point
5 to vague, undefined components of the patentees' purported transmission and reception system,
6 which can supposedly operate on a myriad of different, often-incompatible, technologies and
7 platforms. The actual description of those components and related methods is missing entirely or
8 limited to what the patentees hoped their invention could accomplish. Such disclosure fails the
9 written description and enablement requirements and does not entitle the patentees to the patent
10 system's protections. *See Brenner v. Manson*, 383 U.S. 519, 536 (1966) ("[A patent] is not a
11 reward for the search, but compensation for its successful conclusion.").

12 Acacia's opposition underscores why the Satellite Defendants' motion should be granted.
13 Acacia ignores the Court's claim construction, its own statements and those of its expert, and
14 even a stipulation that it filed with this Court. Because they cannot point to the necessary
15 disclosure, Acacia and its expert repeatedly attempt to rely on what Acacia evidently wishes the
16 patentees had included in the specification, claiming that adequate description is "inherently"
17 found in the specification and the knowledge of those skilled in the art.

18 Acacia's efforts to manufacture disclosure that does not exist cannot create a triable issue
19 of fact or save the inadequately-supported claims from summary judgment. Because the facts
20 necessary to resolving the Satellite Defendants' motion are beyond genuine dispute, the motion
21 should be granted and the asserted claims declared invalid.¹

22 **II. THE ASSERTED METHOD CLAIMS THAT DO NOT INCLUDE A USER
23 REQUEST FAIL THE WRITTEN DESCRIPTION REQUIREMENT.**

24 Acacia does not dispute the specification's numerous statements regarding user-selected
25 transmissions, its expert's opinion that the patent is fundamentally about video-on-demand, the
26 specification's distinguishing of *every* prior art reference based on a purported lack of user

27 ¹ The Satellite Defendants also join the Round 3 Defendants' Reply brief. The Satellite
28 Defendants write separately to address issues specific to the Satellite Defendants' motion.

1 requests, and the Court’s conclusion that “every part of the specification” describes sending
2 information in response to user requests. As the Satellite Defendants have shown, the asserted
3 method claims are thus invalid because they claim more broadly than the specification describes.

4 Acacia contends that a single original claim somehow provides the required written
5 description support for these claims. Acacia’s argument was expressly rejected by the Federal
6 Circuit in *LizardTech*. There, the patent described a method for creating a seamless discrete
7 wavelet transform (DWT) to compress digital images. *LizardTech, Inc. v. Earth Resource*
8 *Mapping, Inc.*, 424 F.3d 1336, 1337 (Fed. Cir. 2005). The specification disclosed only one
9 method for creating a seamless DWT, which required “maintaining updated sums of DWT
10 coefficients.” *Id.* at 1344. Claim 21 of the issued patent, however, lacked the “maintaining
11 updated sums” limitation and was thus broader than the disclosure. *Id.*

12 In holding the claim invalid, *the Federal Circuit rejected the identical argument that*
13 *Acacia makes here*. Like Acacia, LizardTech argued that because an original claim lacked the
14 “maintaining updated sums” limitation, the inventors were in possession of different methods of
15 performing DWT-based compression to create a seamless DWT. The Federal Circuit disagreed:

16 While it is true that an originally filed claim can provide the
17 requisite written description to satisfy section 112, *see Union Oil*
18 *Co.*, 208 F.3d at 998 n. 4, nothing in claim 21 or the specification
constitutes an adequate and enabling description of all seamless
DWTs.

19 *Id.* at 1346.² As the Federal Circuit held in *Enzo Biochem, Inc. v. Gen-Probe, Inc.*, 323 F.3d 956,
20 968-69 (Fed. Cir. 2002), “[i]f a purported description of an invention does not meet the
21 requirements of the statute, the fact that it appears as an original claim or in the specification does
22 not save it. A claim does not become more descriptive by its repetition, or its longevity.” If the
23 words of the claim are not in and of themselves sufficient to describe the subject matter, whether
24 they were in an original claim or not, the specification must still provide sufficient written
25 description in order to support the later-issued patent claim.

26 _____
27 ² Acacia’s opposition relies on the same *Union Oil* footnote that the *LizardTech* court
28 found unpersuasive. (Opp’n at 96 (citing *Union Oil Co. of Cal. v. Atlantic Richfield Co.*, 208
F.3d 989, 998 n.4 (Fed. Cir. 2000))).

1 As in *LizardTech*, neither the specification nor original Claim 1 provides an adequate
2 description of a method of transmitting data without a user request. For example, original
3 Claim 1 requires that “at least a portion of one of the files” is transmitted. Like the method
4 claims without user requests, however, it fails to explain how a portion of an item, or any item,
5 could be defined or selected or possibly be sent without a user request, when such a transmission
6 would occur, or what portion of the item would be transmitted. As this Court found:

7 Every part of the specification *clearly states an intent* by the
8 inventors that the “transmission system” and the “receiving system”
process, store, send and receive the information *specifically in*
9 *response to “users.”*

10 (Ex. I, *Markman VI* at 4 n.5 (emphasis added).)³ Acacia cannot rely on an original claim that also
11 fails to include an element required by the specification to save other similar, inadequately-
12 described method claims.

13 Acacia also misleadingly quotes the specification in an effort to argue that the applicants
14 included a “transmitter means,” which, according to Acacia, did not provide for user requests.
15 (Opp’n at 95-96.) But the text quoted by Acacia plainly states that the “transmitter means” can
16 only send “a **specific** file to a **specific** one of the remote locations.” (Opp’n at 98 (quoting ’992
17 patent, 2:46-48) (emphasis added).) The *very next sentence* from the specification makes it clear
18 that the “specific file” and “specific location” are selected by the user:

19 The present invention further comprises a distribution method
20 *responsive to requests identifying information to be sent from a*
21 *transmission system to a remote location*, the method comprising
22 the steps of storing audio and video information in a compressed
23 data form; *requesting transmission, by a user, of at least a part of*
24 *the stored compressed information to the remote location*; sending
25 at least a portion of the stored compressed information to the
26 remote location; receiving the sent information at the remote
27 location; buffering the processed information at the remote
28 location; and playing back the buffered information in real time *at a*
29 *time requested by the user.*

3 Exhibits are attached to the Declaration of Matthew I. Kreeger (D.I. 298) unless
otherwise noted.

1 '992 patent, 2:49-61 (emphasis added). Thus, like the other components of the transmission
2 system, the “transmitter means” also depends on user requests to designate the item to be
3 transmitted, the location to which the transmission is sent, and the time of the transmission.

4 Acacia also argues that the “transmitter means” of Claim 1 can satisfy the “objects” and
5 “purposes” of the invention without employing user requests. (Opp’n at 95-96.) Those objects
6 and purposes, however, expressly include: providing “a user with the capability of accessing
7 audio/video material,” allowing “the user to remotely select audio/video material,” transmitting
8 audio/video material “to any location chosen by the user that has a specified receiver,” allowing a
9 user to play back material “at any time selected by the user,” and allowing a user to select audio
10 material, video material or both. '992 patent, 1:57-2:16. In other words, each of the patent’s
11 purposes references user requests.

12 In fact, the specification language on which Acacia relies is fully consistent with the
13 remainder of the disclosure, which demonstrates that user requests were required by the
14 applicants’ purported invention. *See, e.g., id.* 1:8-10; 1:57-2:10; 2:25-3:15; 3:55-60; 5:10-14;
15 14:3-20, 24-33, 39-40, 45-48; 15:33-54; 18:47-50; 18:53-56; 19:21-24; Figs. 3, 4, 5, 7. For
16 example, the descriptions of the distribution method *each include user requests*. *See, e.g., id.*
17 at 2:49-61; 18:46-59; Fig. 7. Indeed, the distribution method is initiated “*upon a request by a*
18 *user of the distribution system.*” *Id.* at 18:53-56 (emphasis added). Even Mr. Weiss admits that
19 the patent is fundamentally about video-on-demand. (Open. Br. at 6 (quoting 9/8/05 Hearing Tr.
20 at 27).) Acacia cannot now expand its limited disclosure by claiming more broadly than the
21 specification describes.

22 The Federal Circuit’s recent *ICU Medical* decision confirms that claims cannot be broader
23 than the disclosure. *ICU Med., Inc. v. Alaris Med. Sys., Inc.*, No. 2008-1077, 2009 U.S. App.
24 LEXIS 5271 (Fed. Cir. Mar. 13, 2009). In that case the court held that the “spikeless” claims at
25 issue “refer to medical valves generically—covering those valves that operate with a spike and
26 those that operate without a spike. *But the specification describes only medical valves with*
27 *spikes.*” *Id.* at *17 (emphasis added). The court therefore invalidated the asserted spikeless
28

1 claims because they were broader than the disclosure and a skilled artisan “would not understand
2 the inventor of the ’509 and ’592 patents to have invented a spikeless medical valve.” *Id.*

3 Finally, Acacia ignores the fact that the specification itself discusses and attempts to
4 distinguish numerous prior art references on their supposed lack of user requests. ’992 patent,
5 1:20-56. This confirms that user requests were key to the patent’s disclosure and that the
6 specification does not support broader claims. *See Tronzo v. Biomet, Inc.*, 156 F.3d 1154, 1159
7 (Fed. Cir. 1998) (“Instead of suggesting that the ’589 patent encompasses additional shapes, the
8 specification specifically distinguishes the prior art as inferior and touts the advantages of the
9 conical shape of the ’589 cup. Such statements make clear that the ’589 patent discloses only
10 conical shaped cups and nothing broader.”) (citation omitted).

11 In sum, Claims 41 of the ’992 patent, 17 of the ’863 patent, and 11 of the ’720 patent —
12 none of which includes user requests — do not meet the written description requirement.
13 Dependent Claim 45 of the ’992 patent and Claims 18-19 of the ’863 patent fail the written
14 description requirement for the same reasons.

15 **III. THE SPECIFICATION DOES NOT DESCRIBE OR ENABLE A
“TRANSMISSION SYSTEM” RETAINING PHYSICAL ITEMS.**

16 Acacia does not dispute the Court’s conclusion regarding Claim 41’s initial step that
17 “[t]he specification is silent as to what component of the ‘transmission system’ is capable of
18 performing the ‘retaining’ step.” (Ex. H, *Markman* V at 17 n.17 (emphasis added).) Acacia also
19 does not dispute that its expert, Mr. Weiss, defines the storing requirement to “[require] active
20 maintenance in order to avoid deterioration of the material.” (Ex. L, Weiss Decl. ISO Mot. for
21 Reconsideration at 6.) And Acacia does not point to any part of the specification that describes
22 any such “active maintenance,” including any of the examples recited by Mr. Weiss.

23 Instead, Acacia supposedly finds written description for the “storing” step in a single
24 sentence in the specification that refers to the transmission system “preferably includ[ing] source
25 material library means for temporary storage of items” (Opp’n at 111.) The specification,
26 however, provides no disclosure regarding what the “means for temporary storage” is or what is
27 involved in actively retaining the physical items in the source material library. *Cf. Univ. of*

1 *Rochester v. G.D. Searle & Co.*, 358 F.3d 916, 929 (Fed. Cir. 2004) (patent invalid for lack of
2 adequate written description where specification failed to steer skilled practitioner to compounds
3 that could be used in claimed method). The only structure mentioned in the specification that is
4 even remotely associated with a “source material library means” is the “source material library”
5 itself. *See, e.g.*, ’992 patent, 6:10-15, 23-26. The specification is silent, however, as to what part
6 of the “source material library” performs the retaining function or what the source material library
7 is. Indeed, as the Court has already found, the specification includes *no* disclosure regarding
8 which component can perform the “retaining” function. (Ex. H, *Markman V* at 17 n.17.)

9 Moreover, Acacia’s reliance on the specification’s description of “temporary storage”
10 contradicts Mr. Weiss’s own opinion of what the “storing” step requires. According to
11 Mr. Weiss, the “active maintenance” described by the storing step requires, among other things,
12 “the periodic movement of copies of the content from one medium to another as the medium on
13 which the content is stored reaches end-of-life as an individual unit or when the particular type of
14 medium is no longer supported as a product and is superseded by more modern technology.”
15 (Ex. L, Weiss Decl. at 6.) Plainly, such maintenance is not temporary in nature. Hence, the
16 temporary storage reference does not support Mr. Weiss’s view of the storing step.

17 Acacia contends that the specification need not describe “how” retaining is achieved
18 because “how” is supposedly not a limitation of the asserted claims. (Opp’n at 111.) Mr. Weiss
19 opines, however, that a skilled artisan would read the retaining step to *require* “active
20 maintenance” of the items. At best, the specification provides a “vague functional description” of
21 the step, which would not lead someone of ordinary skill in the art to conclude that the patentees
22 possessed a transmission system invention that actively “retained” physical items in a library. *See*
23 *LizardTech*, 424 F.3d at 1345. Claim 41’s storing step fails the written description requirement.

24 **IV. THE SPECIFICATION DOES NOT DESCRIBE OR ENABLE GETTING
25 INFORMATION BACK FROM THE PHYSICAL ITEMS.**

26 Acacia argues that the written description for Claim 41’s “retrieving” step is found in the
27 specification’s use of an “identification encoding means.” (Opp’n at 112.) But the Court has
28 already determined that the “identification encoding means” lacks corresponding structure, (Ex.

1 D, *Markman I* at 21), and that one of ordinary skill “would not understand the scope or bounds of
2 the structure of the term ‘identification encoder’ when that term is read in light of the
3 specification.” (Open. Br. at 14.) The Court’s conclusion is plainly correct since neither the
4 terms nor the specification impart any understanding as to what an identification encoder is and,
5 therefore, cannot show what the inventors thought of as their invention. *See, e.g., Univ. of*
6 *Rochester*, 358 F.3d at 928 (vague functional description does not satisfy the requirement that the
7 “specification set forth enough detail to allow a person of ordinary skill in the art to understand
8 what is claimed and to recognize that the inventor invented what is claimed”). That the words
9 “identification encoding means” appear in originally filed Claim 1 does not make it any more
10 definite or supportive of the claimed invention. *See, e.g., LizardTech*, 424 F.3d at 1346-37
11 (finding a claim identical to originally filed claim does not automatically satisfy written
12 description requirement where “nothing in [the claim] or the specification constitutes an adequate
13 and enabling description”).

14 Acacia also points to a single sentence from the specification in an attempt to find written
15 description support: “the first step of the distribution method 400 involves retrieving the
16 information for selected items in the source material library” (Opp’n at 112 (quoting ’992
17 patent, 18:53-56).) Acacia ignores the fact that the *transmission system* must perform the steps of
18 Claim 41, as the Court has already found. (Ex. F, *Markman III* at 29.) The sentence upon which
19 Acacia relies does not describe any component of the “transmission system” performing the claim
20 step or the manner in which the “retrieving” is performed. Stating that retrieving is somehow
21 performed is *not* the same as describing the actual manner of retrieval or disclosing a component
22 that can be used to retrieve the information from the physical items stored in the source material
23 library. The mere concept of retrieval, without more, is insufficient to satisfy the written
24 description requirement. *See Univ. of Rochester*, 358 F.3d at 928.

25 As to enablement, Acacia argues that it is met by the specification’s discussion of a digital
26 telecine device and an audio playback device. But the portion of the specification cited by Acacia
27 indicates that the information in the film is retrieved *before* the frames are passed through a
28 telecine device and *before* the audio is passed through an audio playback device:

1 If, for example, the *retrieved information* to be converted from the
2 source material library 111 is a motion picture film, the picture
3 frames in the film are passed through a digital telecine device
4 Accompanying audio information is passed through an optical or
5 magnetic digital playback device.

6 (Opn' at 112 (citing '992 patent, 7:35-43) (emphasis added).) This passage thus only discusses
7 what might happen to the information *after* it is retrieved. It fails to describe the act of retrieving
8 the information from the physical items nor does it identify what part of the transmission system
9 performs that act. Thus, it cannot serve as enabling disclosure for the "retrieving" step.

10 Moreover, the telecine and audio playback devices are limited to manipulating
11 information from motion picture films. In contrast, the retrieving step broadly claims retrieving
12 any digital video or audio data on a variety of physical items. The specification does not explain
13 what retrieves data from other physical items, such as video tapes, laser disks, optical disks,
14 magnetic disks, computer tapes, disks, and cartridges, in the source material library. Acacia does
15 not contend otherwise. Instead, Acacia relies on the conclusory opinions of Mr. Weiss, who
16 states: (1) that skilled artisans knew how to manually retrieve such physical items, (Weiss Decl.
17 ¶¶ 59-60), and (2) that "[i]n many cases, by the start of 1991, it would have been possible to
18 automate the processes of retrieving items from storage and playing them back on appropriate
19 machines, scanning them on appropriate scanners, and the like" (*Id.* ¶ 61 (emphasis added)).

20 Mr. Weiss's opinion highlights the specification's lack of enabling disclosure. The
21 patentee must enable the "full scope" of the claimed invention — not what a skilled artisan would
22 be able to create "in many cases." *In re Wright*, 999 F.2d 1557, 1561 (Fed. Cir. 1993). The
23 specification does not teach how its transmission system would "get back" the information
24 contained on the numerous different types of physical items in the source material library, as the
25 Court's construction requires. Mr. Weiss's declaration only confirms that the full scope of the
26 claim step was not disclosed in the specification or known by those of skill in the art.

27 Finally, the identification encoder, which is the only component disclosed in the patent
28 arguably linked to retrieving information from the physical items, itself is not enabled. The
29 specification does not describe how the device accomplishes the retrieval function (or the
30 numerous other functions that the specification ascribes to it). Such limited disclosure is not

1 enabling. *See Automotive Techs. Int'l, Inc. v. BMW of N. Am., Inc.*, 501 F.3d 1274, 1283 (Fed.
2 Cir. 2007) (“conceptional view” of electronic sensor failed to show one skilled in the art how to
3 make or use the sensor and was therefore not enabling). As the Satellite Defendants’ motion
4 detailed, (Open. Br. at 15), even Mr. Weiss conceded that the “identification encoder” was not an
5 off-the-shelf component available for purchase and that therefore it would have to be specially
6 engineered to meet the particular design requirements of different systems. (Ex. B, 9/9/2005 Tr.
7 at 246-47.) Where the specification fails to disclose structure for any of the technologies
8 mentioned, a “mere boxed figure [of the device] and the few lines of description fail to apprise
9 one of ordinary skill how to make and use [the device].” *Automotive Techs.*, 501 F.3d at 1283.
10 Similarly, Acacia’s vague black-box description of the identification encoder fails the enablement
11 requirement.

12 **V. THE SPECIFICATION DOES NOT DESCRIBE OR ENABLE “INPUTTING AN
13 ITEM . . . INTO THE TRANSMISSION SYSTEM.”**

14 As Acacia has previously conceded, the specification includes *no* disclosure regarding
15 inputting items into the transmission system. As a result, neither the written description nor the
16 enablement requirements have been met for independent Claim 17 and dependent Claims 18-19.

17 Acacia first tries to find support for the “inputting” step by arguing that something other
18 than the transmission system could perform this step. Acacia ignores the fact that the parties have
19 already stipulated that the claims *require* the transmission system to perform the step:

20 In Claim 17 of the ’863 patent, the “formatting step” includes . . .
21 (a) “inputting an item having information into the transmission
22 system”; . . . the parties agree that . . . *the formatting steps,
23 including steps (a) - (d) listed above, are performed by the
24 transmission system.*

25 (Ex. J, 7/21/2006 Stip. at 3 (emphasis added), filed at D.I. 187.) Acacia argues that the Court did
26 not address the transmission system performing Claim 17’s formatting steps. (Opp’n at 104
27 n.40.) The Court’s constructions of other terms in Claim 17, however, are completely consistent
28 with Acacia’s stipulation that the transmission system performs the claim’s formatting steps.
Acacia cannot defeat summary judgment by ignoring the claim construction to which it formally
stipulated almost three years ago. *See JSR Corp. v. Tokyo Ohka Kogyo Co.*, No. C 99-20156 JW,

1 2001 U.S. Dist. LEXIS 24959, at *16-19 (N.D. Cal. Sept. 12, 2001) (denying plaintiff permission
2 to change “stipulated construction” and invalidating claims based on stipulation where parties and
3 Court relied on it by abandoning “a timely claim construction hearing, and [the defendant]
4 prepared and filed its summary judgment motion” since to allow amendment “would encourage
5 the ‘vexatious shuffling of positions’ that the patent local rules were designed to avoid”).

6 In any case, Claim 17 fails the written description requirement — whether the “inputting”
7 is performed by the transmission system or some mysterious, undisclosed component — since
8 there is no disclosure of *anything* “putting physical items . . . into the transmission system.” As
9 the Satellite Defendants’ motion demonstrated, Acacia’s counsel told this Court that the
10 specification does not describe “how information gets placed into a source material library” since
11 “all that is being disclosed isn’t that, as how things are being stored or put in. It’s just that they’re
12 there.” (Open. Br. at 17 (quoting 8/17/2007 Tr. at 202-03).) Even Acacia’s opposition concedes
13 that the specification “does not use the specific words or present drawings which explicitly state
14 or depict that an item of information is input into the ‘transmission system.’” (Opp’n at 105; *see also* Ex. H, *Markman V* at 16; Ex. G, *Markman IV* at 23; Ex. F, *Markman III* at 30.)

16 Acacia’s opposition ignores these admissions, and instead argues, based on an expert
17 declaration, that the specification “inherently” describes the inputting step. (Opp’n at 106.)
18 According to Acacia, because the specification shows items in the source material library, they
19 must necessarily have first been input into the transmission system. (*Id.*) But Acacia’s argument
20 sidesteps the issue — there is no disclosure, inherent or otherwise, of the transmission system or
21 anything else “inputting” items as the claim language (and the Court’s construction) requires.

22 To be inherent “the missing descriptive matter must necessarily be present in the parent
23 application’s specification such that one skilled in the art would recognize such a disclosure.”
24 *Tronzo*, 156 F.3d at 1159. Disclosure that would be obvious to one skilled in the art is not
25 enough — “[i]t is not sufficient for purposes of the written description requirement of § 112 that
26 the disclosure, when combined with the knowledge in the art, would lead one to speculate as to
27 modifications that the inventor might have envisioned, but failed to disclose.” *Lockwood v. Am.*
28 *Airlines, Inc.*, 107 F.3d 1565, 1572 (Fed. Cir. 1997); *see also Regents of the Univ. of Cal. v. Eli*

1 *Lilly & Co.*, 119 F.3d 1559, 1566-67 (Fed. Cir. 1997) (explaining that “an applicant complies
2 with the written description requirement by describing the invention, with all its claimed
3 limitations, not that which makes it obvious”) (internal quotation marks omitted). The issue is *not*
4 “whether one skilled in the art might be able to construct the patentee’s device from the teachings
5 of the disclosure of the application. Rather, it is a question whether the application necessarily
6 discloses that particular device.” *Univ. of Rochester*, 358 F.3d at 923. Where there is *no*
7 disclosure, Acacia cannot manufacture missing pieces with the opinion of its retained expert.

8 The Federal Circuit’s decision in *TurboCare Division of Demag Delaval Turbomachinery Corp. v. GE, Co.*, 264 F.3d 1111 (Fed. Cir. 2001), refutes Acacia’s argument. In *Turbocare*, the
9 patent covered seals used in fluid-driven devices such as steam turbines. *Id.* at 1113. The
10 defendant raised written description challenges as to the type and location of springs used in the
11 seals. *Id.* at 1118. As to the location, the specification said only that the springs were “located . .
12 . adjacent to” ring segments. *Id.* at 1119. The patentee argued that the only viable location for
13 the springs “would be between the casing shoulders and the shoulders of the outer ring portion of
14 the segment” and that the subject matter was therefore inherently disclosed. *Id.* The Federal
15 Circuit rejected the patentee’s argument and the “conclusory statements” of its expert witness:
16

17 [The inventor’s] original disclosure is *completely lacking* in any
18 description of an embodiment in which the spring is located
19 between the casing shoulders and the inner surface of the outer ring
20 portion of the ring segment. Such an embodiment may have been
21 obvious from [the inventor’s] vague reference to a “spring located
22 . . . adjacent to said rings.” As we held in *Lockwood v. American
23 Airlines, Inc.*, 107 F.3d 1565 (Fed. Cir. 1997), however, that is not
24 enough to satisfy the written description requirement.

25 *Id.* (emphasis added). The court thus affirmed the district court’s holding that the spring’s
26 location was not inherently disclosed and that a skilled artisan would not have recognized that the
27 patentees invented what was claimed. *Id.*; *see also PowerOasis, Inc. v. T-Mobile USA, Inc.*, 522
28 F.3d 1299, 1306-10 (Fed. Cir. 2008) (rejecting “conclusory expert declaration” and argument that
“customer interface” could inherently be part of customer’s laptop, rather than vending machine,
where there was “simply no disclosure in the Original Application of a user interface that is either
located on a customer’s laptop or even separate from the vending machine itself”).

1 Here, like *TurboCare* and *PowerOasis*, there is no disclosure of the transmission system
2 or anything else “inputting” physical items into a source material library. The applicants failed to
3 disclose the step itself, what is performing the step, or how anything could possibly accomplish
4 the “inputting” function. That items may eventually arrive in the source material library does not
5 address what put them there or how the applicants’ supposed invention performed that action.

6 Accordingly, Claim 17 and dependent Claims 18-19 fail the written description
7 requirement. *Univ. of Rochester*, 358 F.3d at 922-23. Because the specification fails to disclose
8 *anything* regarding how one of skill in the art would make or use the invention, the claims are
9 also not enabled. *Automotive Techs.*, 501 F.3d at 1285; *LizardTech*, 424 F.3d at 1344-46.

10 **VI. CLAIM 11 OF THE '720 PATENT FAILS TO DESCRIBE OR ENABLE
11 SUBSCRIBERS TO DESIGNATE INDIVIDUAL RECEIVING DEVICES.**

12 Acacia argues that the specification describes and enables the “subscriber selectable
13 receiving stations” of Claim 11 of the '720 patent because it mentions users selecting the
14 locations where transmissions are received and because its expert opines that “conditional access”
15 technology was known in the art. (Opp’n at 116-18.) Acacia misses the point. Selecting a
16 “location” is *not* the equivalent of selecting a receiving station, and Acacia cannot rely on the
17 knowledge of its experts or one of skill in the art to overcome the specification’s failings.

18 According to Acacia’s own prosecution history statements, the novel aspect of Claim 11
19 was the purported selectability of the receiving stations. The *only* distinction asserted by the
20 applicants between Acacia’s application and the Hoarty reference was that Hoarty “does not
21 allow the user to select another premises or a subscriber *selectable* receiving station to which
22 information is transmitted.” (Ex. P, 6/7/1999 Reply and Amendment at 8 (emphasis in original).)
23 In other words, the applicant asserted that Claim 11 was novel because it allowed the user to
24 choose a remote location, *as well as* to “designate” a particular receiving station.

25 Under well-established Federal Circuit law, Claim 11 is thus not described or enabled:

26 “It is the specification, not the knowledge of one skilled in the art,
27 that must supply the novel aspects of an invention in order to
constitute adequate enablement.” Although the knowledge of one
skilled in the art is indeed relevant, *the novel aspect of an invention
must be enabled in the patent. . . .* Given that the novel aspect of the

1 invention is side impact sensors, it is insufficient to merely state
2 that known technologies can be used to create an electronic sensor.
3 *Automotive Techs.*, 501 F.3d at 1283 (quoting *Genentech, Inc. v. Novo Nordisk A/S*, 108 F.3d
4 1361, 1366 (Fed. Cir. 1997) (emphasis added)). The novel aspects of an invention require an
5 enabling disclosure *regardless* of the knowledge in the art.

6 Acacia’s opposition ignores these prosecution statements confirming that the supposedly
7 novel feature of Claim 11 was the ability of a user to select a receiving device. Instead, Acacia
8 conflates the user’s ability to select from among different locations *and* from among different
9 devices. Acacia points to several areas of the specification that it claims describe the user’s
10 ability to designate receiving devices. But *each* of these citations points to a user’s ability to
11 select the location that receives transmissions — *not* the user selecting a particular device.
12 (Opp’n at 117.) For example, the citations refer to the ability of the user to select the
13 “destination,” “premises,” “location of playback,” or “address of the user.” None of these
14 references mentions the ability of a user to select from among various “receiving stations.” Nor
15 do the cited portions of the specification refer to the ability of a subscriber to designate a
16 “receiving device or devices.” In fact, they do not mention “receiving devices” at all.⁴

17 When the Yurt patentees wanted to claim sending transmissions to a specific “location” or
18 “premises,” they knew how to do so. *See, e.g.*, ’992 patent, Claims 1 (transmission to “one of the
19 remote locations”), 41 (same), 19 (transmission to “selected remote location”), 47 (same); ’275
20 patent, Claims 1 (transmission to “one of the remote locations”), 2 (same), 4 (same), 5 (same), 7
21 (same); ’863 patent, Claims 1 (“one of the remote locations”), 10 (“one of a plurality of the
22 remote locations”). The ’720 patent itself claims a transmission system that sends data to “the
23 *premises selected by the user*” without referring to “receiving stations.” ’720 patent, Claim 1
24 (emphasis added). In contrast, Claim 11 claims transmissions to “selectable receiving stations” at

25 _____
26 ⁴ Acacia points to a passage in the specification that refers to transmitting data faster than
27 real time “to any location chosen by the user that has a specified receiver.” (Opp’n at 117 (citing
28 ’992 patent, 1:67-2:4).) But what that “specified receiver” is, how subscribers can designate it
from among different receivers, or whether it is even the equivalent of a receiving device, the
specification never says.

1 a “*premise* geographically separated from the *location* of the local distribution system.” Simply
2 put, selecting a “location,” “premises,” “user address,” or “destination” is *not* the same as
3 designating a “receiving device” from among multiple such devices, as the claim language and
4 the Court’s construction require.

5 Even Acacia’s expert, Mr. Weiss, concedes that the specification does not describe the
6 claim term. Mr. Weiss states that in the claimed system, “the Reception Systems must be
7 addressable in such a way that they only will receive content that is addressed to them.” (Weiss
8 Decl. ¶ 165.) Such addressability could be “obtained through a method known as ‘conditional
9 access,’” which by 1991 was “well and widely known.” (*Id.* ¶ 166.)

10 But the specification says *nothing* about “conditional access.” Indeed, Mr. Weiss
11 concedes that such addressability is not described in the specification. Instead, he states:

12 For the redistribution method to function, there needs to be a
13 transfer of information from the Transmission System to a
14 subscriber management system associated with the conditional
15 access system on the output of the Reception System, so that the
16 subscriber management system can direct specific content from the
17 Reception System to a specific subscriber. *The need for such*
information transfers is inherent in the configuration of the systems
presented in Figures 1d, 1e, and 1f, and the text describing them in
the specification of the ’992 patent. The information transfer
18 process would be part of the software processes necessary to
operate the overall transmission and reception system and would
have been apparent to one of ordinary skill in the art at the
beginning of January 1991.

19 (*Id.* ¶ 167 (emphasis added).)⁵ Thus, according to Mr. Weiss, the specification only describes an
20 “inherent” “need” for accomplishing information transfers “necessary” to a conditional access
21 method of distribution. Obviously, a “need” is not the equivalent of “descriptive means [such] as
22 words, structures, figures, diagrams, formulas, etc., that fully set forth the claimed invention.”
23 *Lockwood*, 107 F.3d at 1572. Such disclosure would do nothing more than provide a place holder
24 for future development. *See Automotive Techs.*, 501 F.3d at 1284 (“[T]he specification provides

25 ⁵ Mr. Weiss’s declaration also finds disclosure where there is none. In the words of the
26 specification each of Figures 1d, 1e, and 1f only describes a “high level block diagram.” ’992
27 patent, 4:14-36. The diagrams simply show boxes representing transmission and reception
systems connected by lines. They and the associated text in the specification say nothing about
conditional access, designating receiving devices, or anything else about user selectability.

1 ‘only a starting point, a direction for further research’ on using electronic sensors for sensing side
2 impact crashes; it does not provide guidance to a person of ordinary skill in the art on how to
3 make or use an electronic side impact sensor.”) (citation omitted).

4 Mr. Weiss’s declaration presents the kind of opinion that the Federal Circuit has
5 specifically held does not satisfy the enablement requirement: litigation-driven expert opinion
6 that substitutes for the “novel” aspects of the claimed invention. *Automotive Techs.*, 501 F.3d at
7 1283. Here, Mr. Weiss’s opinion could not be clearer — the specification does not disclose
8 “conditional access.” According to Mr. Weiss, the “selectable” function of the receiving stations
9 presented an “inherent need” that would signal to a skilled artisan what was required.

10 Mr. Weiss’s opinion and Acacia’s opposition ignore the fact that the Yurt applicants relied on the
11 so-called novelty of the receiving stations’ selectability *as the only basis for distinguishing the*
12 *Hoarty reference*. Indeed, Mr. Weiss’s opinion contradicts the applicants’ statements that the
13 “receiving stations” selectability was supposedly novel. Acacia cannot substitute Mr. Weiss’s
14 opinions in place of what the applicants failed to include in the specification.⁶

15 For all these reasons, Claim 11 lacks written description. And because the specification
16 does not enable even the basic features of the receiving stations — “novel” features on which the
17 applicants relied to gain allowance, Claim 11 also fails the enablement requirement.

18 **VII. CONCLUSION**

19 For all the above reasons, Claims 41 and 45 of the ’992 patent, 17-19 of the ’863 patent,
20 and 11 of the ’720 patent fail the written description and enablement requirements.

21
22
23
24

⁶ Neither Acacia nor Mr. Weiss explains how “conditional access” systems would work
25 across the diverse technologies, such as broadcast TV, ISDN, microwave, cable, or satellite
26 delivery systems, described by the patent. *See, e.g.*, ’992 patent, 15:66-67, 16:4-15. Whether the
27 patent’s “subscriber selectable receiving stations” are (or include) modems, satellite receiving
dishes, cable set-top boxes, broadcast antennas, or related devices, the specification and Mr.
Weiss do not say. *See In re Ghiron*, 442 F.2d 985, 991 (C.C.P.A. 1971) (“If . . . practice [of a
method claim] requires [a] particular apparatus, . . . it is axiomatic that the application must . . .
provide a sufficient disclosure of that apparatus if such is not already available.”).
